

ESIS

ESIS and Hygienetics conduct subsurface soil and groundwater investigations to assess and evaluate recognized environmental conditions at properties throughout the United States and to determine potential impacts from various types of contaminant sources.

The primary objective of performing subsurface soil and groundwater investigations is to evaluate recognized environmental conditions for the purpose of providing sufficient information regarding the nature and extent of contamination.

The level of assessment can vary and is based on the business objectives and needs of the client. Subsurface investigations are performed in accordance with ASTM E1903-97 "Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process," and applicable local, state, and federal programs and regulations.

Hygienetics has provided remediation program development for sites designated as Brownfields, to oversee and manage the remediation of site contaminants, with the intended purpose of receiving regulatory approvals for site remediation in accordance with federal, state, and local regulations. Following remediation, these sites can be redeveloped, and the owners of the site and structures receive credits to LEED certification for building redeveloping a former Brownfield site.
